Observe that the two triangular figures PQP , PR S , each with an arc side, are similar figures, with P as center of symmetry, and N as ratio of similitude. Since PR S approaches coincidence with the triangle PRS, it O M B L L X appears that the difference figure PQP approaches similarity with the differential triangle PRS, as its sides indefinitely diminish. The difference figure reduces to the point P; we have left, however, in the triangle PRS what might be called its ultimate form. (a) The limiting ratio of any arc to its chord as the arc is taken smaller and smaller, is unity. For, $PP \text{ arc } PP = PS \text{ arc } PS$, whose limit is PS: PS=l (b) The slope of the curve $y=fx$ at the point (x, y) is $dy / dx=f x$. For, the slope is $\tan f=RS/PR=dy/dx$. (c) Inverse Principle 1. If $dw \rightarrow 0$ identically, then $w=\text{constant}$. Or, if $du=dv$ identically, then $d(u-v)=0$ identically, and $u-v=\text{constant}$. For the slope of $y=fx$ being dy/dx , then if $dy \rightarrow 0$ for a particular value of x , at such point (x, y) S coincides with R, or the tangent is parallel to OX; if $dy=0$ for every value of x , then the tangent is parallel to OX at every point, and the curve $y=fx$ must be a straight line parallel to OX, so that $y=fx$ remains constant as x changes.
