Excerpt: . . . progression or evolution of moving plasma and electron distributions, one should be able to eliminate some transport processes from the realm of potential flare producing agents. One most easily identified, and perhaps eliminated, is the propagating modes of magnetic reconnection due to the wide range of Alfvén speeds within different coronal structures. By proposing such observations to the experimentalists, one must discuss the limitations of the measurements and alternatives which may be offered which address the same problem. The interplay between the theorists and the experimentalists is important in formulating a program for the upcoming maximum. The remainder of this review paper addresses only the contents of the contributed talks and poster papers. The details of each presentation can be found elsewhere in this volume. We only address the global aspect of the session. 2. The Gamma Ray Observatory The Gamma Ray Observatory (GRO) will carry four large instruments whose main objectives are to undertake comprehensive observations of astrophysical sources throughout the 15 keV to 30 GeV energy range. However, GRO will also provide significant capabilities for observations of energetic solar gamma rays and neutrons, and therefore be an integral part of the MAX 91 program. GRO is scheduled for launch in June 1990, near the peak of the current sunspot cycle. A 6-10 year mission lifetime is expected. . 1 Solar Physics with GRO The GRO instruments, briefly described below, provide enhanced capabilities for solar flare observations relative to previous high-energy instruments (Kurfess, 1988). Im-proved sensitivities and time resolutions will be available over a broad...
